

WEIGHT MANAGEMENT

The main goal of obesity and/or weight management is to provide a safe means of exercise in addition to whatever nutritional and medical care the dog is already receiving.

The primary means of exercise is hydrotherapy so the dog can exercise without the added joint stress secondary to obesity. The program will be monitored for the dog's tolerance.

Key Uses

Obesity, thyroid problems, weight management, regular exercise to increase metabolic rate.

For extreme cases or those under a veterinarian's medical management for obesity, a veterinarian referral and combined approach (including progress reports) may be necessary.

HEALTH & SAFETY

To ensure high standards of hygiene, our water management system filters, heats and sanitizes the water through a circulation pump, a specially designed in-line electric heater and a high-rate filter system before a low dose of chlorine is added manually.

Doggy life vests are available for those dogs just learning to swim or those needing a little support.

ANIMAL REHABILITATION

Rehabilitation is a universally accepted standard of care in human medicine. Recently the benefits of rehabilitation have been recognized in veterinary medicine. This therapy is now available to aid in recovery of these conditions in animals.

Animal Rehabilitation aims to restore normal movement, muscle mass & function, reduce pain, swelling and inflammation.

Treatments techniques include:

- Soft tissue and joint mobilizations
- Stretching
- Strength & Endurance
- Movement re-education
- Massage, trigger point therapy and myofascial release
- Balance and proprioception re-training
- Thermotherapy
- Dry needle, laser, aqua, electro and acupuncture
- Underwater treadmill & hydrotherapy
- Thermoplastic splinting
- PST—Pulsed Signal Therapy
- Athletic Conditioning
- Chiropractic manipulation
- Iontophoresis & Phonophoresis
- Prolotherapy/Neural therapy

UNDERWATER TREADMILL

P.A.W.S. is the first to offer Underwater Treadmill for pets in the Tucson area. Our state of the art Treadmill revolutionizes rehabilitation and fitness. This aids in recovery from a variety of ailments.

- Neurological
- Weight loss
- Orthopedic
- Conditioning
- Post Surgical Strengthening
- Strengthening of Muscles & Joints in arthritic patients

Underwater Treadmill Therapy has been proven to achieve great results in paretic & paralyzed dogs following spinal injury or surgery, or those with other neurological conditions. By using the treadmill to retrain standing and walking, many pets with spinal injuries will walk in the treadmill with minimal or no assistance. This will help retrain them before they are able to walk independently.

Conditions that may benefit from Rehabilitation and the Underwater Treadmill include:

Musculoskeletal Conditions:

- Cruciate injury
- Patella luxation
- Hip dysplasia
- Total hip replacement
- Arthritis/degenerative conditions
- Muscle strains and ligament sprains
- Corrective orthopedic surgery
- Soft Tissue

Neurological Conditions:

- Spinal Surgery
- Spinal disc disease
- Spinal cord shock/trauma
- Nerve palsies or injuries
- Degenerative Myelopathy

REHABILITATION PLANS

On the first visit, a veterinarian trained in rehabilitation will assess your pet and develop a rehabilitation plan specific to your pet's needs. Many factors are considered when designing a rehabilitation program and deciding which particular therapies will be suitable for each animal. The factors are as follows:

- Age/Temperament
- Type of injury
- Time since injury
- Pre-existing conditions
- Lifestyle/occupation of pet
- Recovery Goals

Home programs are provided to all Rehabilitation clients to enable rehabilitation to be continued at home on a daily basis.

VETERINARY REFERRAL

We liaise regularly with your pet's veterinarian to ensure continuity of care and ensure any specific rehabilitation requirements are met. A Veterinary Referral is important to make sure your dog has a correct diagnosis, all relevant tests and any medical/surgical requirements have been performed.

Communication is vital to ensure common goals are set and any specific recommendations or contraindications are followed.
